Take extra precautions to __protect__ your data online.

Use Multi-Factor Authentication!

Sadly, the internet is still a risky place and whenever we go online we can become vulnerable to __hackers__ breaking into our accounts & using our information for nefarious purposes. Hackers do not care how young or old you are, if they think your information is of valuable use, __they will try to take it__!

Thankfully, it doesn't have to be this way. With Multi-Factor Authentication (MFA), you can add an extra layer of protection using a security method only YOU can possess, like your fingerprint, a push notification, or a one-time code sent to your phone.

With this in mind, you will be able to minimalize the chances of hackers gaining access to your information (and accounts) online!

STAY SAFE!
